

CLASH OF THE **CLAWS**

Team Name: ClosedClaw

**"Navigating Corporate
Knowledge, One Click at a Time."**

Samartha Saradka

Sanjeev N

Problem Statement

Why you selected this theme

- We selected the On-Device AI theme because repository analysis often involves sensitive source code, and running AI locally ensures better privacy and security.
- On-device execution also provides faster real-time responses without depending heavily on cloud connectivity, making onboarding smoother and more efficient.

Problem Statement

- **The Knowledge Gap:** New hires are often dumped into a massive volume of disparate documents (PDFs, wikis, old drives) with no map.
- **Information Overload:** Existing onboarding materials are siloed and overwhelming, leading to 'analysis paralysis.'
- **Time-to-Productivity:** The time taken for new employees to understand roles, processes, and key contacts is excessively long (weeks/months).

Why you selected this theme

- **Impact Focus:** We recognized that inefficient onboarding wastes company capital (time and training budget) and costs the employee morale.
- **Technology Relevance:** This problem perfectly utilizes advanced NLP, RAG architectures, and AI to solve a real-world, high-volume enterprise pain point.

What problem are you solving?

- We are eliminating the "Information Jungle" of corporate onboarding by providing an AI-guided journey map that delivers hyper-relevant, contextual knowledge exactly when and where the user needs it.

Who Faces it (persona)?

1. **The New Hire:** Confused, stressed, overwhelmed by documentation ("Where do I even start?").
2. **The Manager/HR Dept:** Struggles to prove that onboarding is efficient or scalable; manually answering repetitive questions.

Why is it important?

- **For the Company:** Faster time-to-productivity means quicker ROI on new hires. It standardizes and professionalizes the corporate knowledge transfer process.
- **For the Employee:** Reduces anxiety, increases confidence, and accelerates feeling like a true part of the team.

Current Solution & Gaps

Existing solutions

1. **HR Wikis/LMS (Learning Management System):** Good for structured training but fails when knowledge is unstructured or buried in old documents.
2. **Google Search/SharePoint:** Requires the user to know what they are searching for and often returns too many irrelevant links.
3. **Manual Mentors:** Great for one-on-one, but not scalable across hundreds of new hires.

What's missing/broken?

- **Lack of Contextualization:** Current tools search documents, but they don't understand the user's journey. They don't know that "understanding payroll" only matters after "completing benefits enrollment."
- **Failure to Map Relationships:** Documents are treated as isolated files. Our system maps relationships (e.g., Document A is required before completing Task B).
- **Unstructured Knowledge Loss:** Critical knowledge remains trapped in old emails, slide decks, and forgotten drives —areas current systems cannot crawl efficiently.

Opportunity

- To build a single source of truth that doesn't just search for keywords, but understands the sequence, relationships, and context required to successfully onboard an employee into any specific role or department.

Your Solutions

What we built & Core Ideas Explanation

OpenClaw is an AI-powered Onboarding Archeologist that ingests all disparate corporate knowledge sources (wikis, PDFs, SOPs, internal docs). It doesn't just index them; it creates a dynamic, personalized journey map for the new user.

- **Archeology:** The system acts as an 'archeologist,' digging up critical insights from forgotten or poorly organized institutional memory.
- **Guidance:** Instead of a massive document dump, it guides the user step-by-step through necessary knowledge blocks based on their role and progress.

Key Features

- **Semantic Search:** Goes beyond keywords; understands the meaning behind a query across all ingested documents.
- **Workflow Mapping:** Builds a visual, personalized checklist that sequences learning tasks logically (e.g., Step 1: Benefits > Step 2: Payroll Form X).
- **Knowledge Gap Identification:** Highlights exactly which critical pieces of information or training the user is missing for their role.

Demo/Product Walkthrough

1. **Start:** New Hire lands on OpenClaw and enters their Role (e.g., "Junior Backend Developer").
2. **Diagnosis:** The system analyzes the role requirements against existing corporate knowledge.
3. **The Journey Map View (Main Screen):** A clean, visual dashboard shows the user's progress through mandatory modules/tasks for that role.
4. **Interaction:** When the user clicks a module (e.g., "Git Workflow"), the system doesn't send them to a PDF—it delivers a concise summary, links to the specific section of the SOP, and perhaps generates a quick quiz based on the content.

Key Moments (The 'Wow' Factor)

- **Moment 1:** The moment the user asks a complex question ("How do I expense international travel using last year's policy?") and OpenClaw instantly pulls accurate data from an old, forgotten PDF, citing the source precisely.
- **Moment 2:** The system dynamically adjusts the map when the manager adds a new required training module, showing it immediately to the user.

Tech & Architecture

- **Frontend:** React / Next.js (For fast, reactive UI).
- **Backend/API:** Python (Flask/FastAPI) (Standard for AI processing).
- **Database:** Vector Database (Pinecone / ChromaDB) (CRITICAL) and PostgreSQL.

AI usage (model, APIs, Framework)

- **Core Engine:** Large Language Models (LLMs like OpenAI's GPT-3.5/4 or custom open models).
- **Architecture:** Retrieval Augmented Generation (RAG). This ensures the LLM answers are grounded in your company's documents, preventing hallucinations.

Impact & Use cases

Real life scenario

1. Global Scale: Onboarding a new employee in a satellite office who needs local compliance rules pulled from global SOPs.
2. Product Expansion: Integrating with other enterprise tools (e.g., connecting the onboarding map to Slack channels for department introductions).
3. Role Change/Transfer: When an employee switches departments, OpenClaw generates a completely new "mini-onboarding" journey map based on the new role's requirements.

Scale Potential

Highly scalable! This architecture can be adapted not just for onboarding, but for any large enterprise knowledge domain: Compliance, Internal IT Support, or Advanced Product Troubleshooting (Internal Knowledge Base).

Differentiation

We don't offer a search engine; we offer Intelligence. We understand the relationship between pieces of information.

Strong MOATs:

1. **Contextual Journey Mapping:** Our ability to move beyond simple search and build a personalized, sequential learning path is fundamentally unique in this space.
2. **Institutional Memory Capture (The Archeologist):** We actively solve the problem of knowledge loss trapped in unstructured data sources—a critical pain point that even large enterprises struggle with using standard tools.
